# SKF Food Line ball bearing units

## A complete range of relubrication-free solutions supporting food safety programs

Food and beverage processing is a particularly challenging industry for machinery operations. Strict cleaning regimes for eliminating contaminants and reducing the spread of bacteria mean the machinery will be frequently exposed to pressure washdowns with caustic, antibacterial cleansing agents.

The SKF Food Line ball bearing units offer a complete range of bearing unit solutions for such demanding environments. Lubricated for life and designed to withstand frequent washdowns, the new bearing units solve many of the problems connected to traditional maintenance.

More importantly, they provide a solution to many food safety issues. With food recalls on the rise and safety regulations becoming stricter globally, proactive food safety programs have become the norm.

All SKF Food Line ball bearing units are specifically developed to support these proactive food safety programs. They incorporate SKF's latest advancements in hygienic design and bearing performance to help the industry reach its most critical goals, such as:

- reducing risks to food safety
- increasing the potential for uptime
- reducing maintenance and related costs
- fostering a sustainable culture

*Why blue? The blue colour facilitates in-line optical detection and greatly reduces the risk of undetected product contamination.*

# SKF Food Line ball bearing units – Blue Range

The blue range units have been developed for compliance with food safety regulations – with food grade and corrosion resistant components, using blue materials for optical detectability. Each element has been designed to balance the highest performance and superior hygienic standards considering EHEDG guidelines.\*

Built from the ground up using foodsafe components and hygienic surface design, the units are developed to proactively eliminate contaminant traps and to reduce the spread of bacteria and allergens.

The relubrication-free feature and hygienic design contribute to cleaning water savings, as well as a reduced disposal of grease absorbents. This supports an overall preventive versus disposal oriented environmental culture.

The blue range units can be supplied as open units, or completely sealed units with end cover and back seal.

The patented bearing sealing system and exceptional grease performance contribute to achieving extended bearing life and high reliability. Designed for relubrication-free operations, the units are thus able to reduce maintenance needs and its related grease and labour costs.

\* EHEDG – European hygienic engineering design group – is a forum for food processing equipment manufacturers, users and legislators to discuss issues concerning hygienic design and to stimulate food safety and quality. (source: <https://www.ehedg.org/ehedg/tasks-objectives/>)

## Hygienic design

Surface geometry of the housing, end cover and back seal are designed to resist the build-up of residue and to facilitate easy cleaning.

### Hygienic geometry of the housing reduces potential contaminant traps.

The housing is designed to avoid crevices or recesses where soiling and bacteria might accumulate or become trapped.

There are no split sleeves on the mounting bolt holes, and the manufacturing mould marks are kept at a minimum.

Further, the housing has no sharp corners. All surfaces are angled to prevent pooling. The flat areas on its exterior are those provided to seat rubberised mounting washers.

These advanced housing shapes are the subject of three different design protections.

### All external surfaces of the SKF blue range housing have a smooth surface finish.

Smooth exterior surfaces on the unit is key to achieving good drainability and cleanability – critical factors in preventing bacterial build-up on the exterior of the bearing unit.

The finish is comparable to food industry requirements for the internal surface finish on hygienic tubing and piping.

### The construction makes use of over moulding to achieve an effective base seal.

On its base or mounting face, a food grade rubber forms the base seal. The rubber is selectively over moulded with the composite of the housing to create an effective seal.

As the housing is tightened down, the over-moulded rubber deforms – thereby providing the base seal to the mounting frame. Having this as an integral part of the housing design makes it easier to achieve a more consistent and effective sealing function. It also simplifies the installation.

The end cover incorporates positive locking to the housing to help protect against it being accidentally dislodged.

End covers only contribute to hygiene if they can be relied upon to remain in place and sealed.

The end cover does not require an additional O-ring, which could easily be displaced during mounting or dismounting.

The end cover material is a high-performance thermoplastic polyurethane elastomer. This material provides a rigid, protective end cover with sufficient flexibility to form an effective interference seal with the housing.

Both the retention and sealing features of this end cover are patented.

The back seal offers an additional double sealing protection, stopping food products from entering the bearing cavity.

The back seal seals dynamically against the shaft and statically with the housing. Both sealing features are intrinsic to the detailed design of the back seal and rely on no additional components, such as a spring.

The integral sealing solution of the back seal reduces the risk of damaging components and contaminating the product line. It also eliminates the risk of loss of a separate component.

## Housings

The SKF blue range housings are strong, yet lightweight and chemically resistant. Their hygienic design features make them ideal for following the highest food safety standards.

The housings remain highly stable dimensionally and maintain their expected physical properties despite repeated operational and washdown cycles.

Particularly in wet environments, the housings are more reliable compared to polyamide (PA) and Polybutylene terephthalate (PBT). PA (not geometrically stable) and PBT (subject to hydrolysis if washed down with hot water) are the main two materials commonly utilized in the market.

The composite material for the blue range housings is reinforced polypropylene – a material chosen for its dimensional stability and chemical resistance to detergents and contaminants (**table 1**). Importantly, polypropylene is hydrophobic, distinguishing it from conventional composite housing materials.

The housings feature 40% long glass fibres reinforcement. This reduces the tendency of the housings to creep under temperature and load.

Table 1

### Chemical resistance ratings for polypropylene

<b>Strong alkalis</b>	Excellent
<b>Weak acids</b>	Excellent
<b>Strong acids</b>	Good
<b>Alcohol</b>	Good

The blue range housings are available in the following six designs – all covered by design protection:

Plummer block

Short base plummer block

Oval flanged

3-bolt flanged

Square flanged

Take-up

## Back seal

The primary purpose of the back seal is to protect the bearing unit from “shaft-side” contamination.

The external face of the back seal has been designed to provide sealing against cut-outs. This could for instance mean an enclosure wall or panel that has been drilled to allow clearance for the shaft to pass through to the bearing unit.

On a flanged unit this can be used to seal the shaft access or clearance hole in order to avoid the creation of a cavity behind the panel, where food debris could otherwise collect.

The composite blue housing is the only housing that can host a back seal. It can only be mounted in a unit with a dedicated bearing.

**Static:** Interference of small rubber undulations or waves, against a matching groove in the SKF blue range housing.

**Dynamic:** A twin lip seal with sufficient interference to cope with 1-degree misalignment.

## End cover

The end cover improves operator safety and provides an additional barrier to the ingress of process material and cleaning agents.

Positive retention to the housing is provided by four circumferential interlocking areas, which require a locked cover to be rotated before it can be removed.

In the locked position, each of the four “teeth” on the end cover are secured in position by two adjacent housing teeth. This helps protect against the end cover being dislodged accidentally or during cleaning.

The resistance to rotation provided by the inter-locking teeth must be overcome before the cover can be rotated.

The end cover is designed to be routinely opened for inspection and then re-locked. Both the housing and the end cover feature laser marked lock and unlock symbols, so that the end cover lock status can be easily confirmed.

Twist to lock or to unlock (1/8 turn), with no tools required.

*The end cover locking mechanism and sealing features are patented.*

The housing marker aligns with the end cover symbol:

- a circle – end cover unlocked, ready to pull away or to relock.
- a filled circle – end cover now correctly locked in position.

### End cover resistance

The end cover’s ability to resist high pressure cleaning at 70 bar has been tested. Throughout the tests, the end cover remained locked in place, and completely sealed. An inspection of the interior of the end cover on completion of the tests, confirmed no soiling was present.

### End cover effectiveness

Repetitive opening and closing operations that were the equivalent of weekly checks over a four-year period, resulted in no loss of effectiveness in the locking and sealing functions.

## Insert bearings and sealing system

At the heart of each unit is a high-quality corrosion resistant insert bearing with AISI grade 420 stainless steel inner ring, outer ring and balls. The Blue Range bearing units also incorporate a patented, bearing sealing system that adopts a radically different approach to preventing damage caused by detergent ingress into the bearing.

The bearing is designed as a single row deep groove ball bearing with a sphered (convex) outside surface to the outer ring. The sphered surface matches a correspondingly sphered, but concave, housing bore. The design minimises internal loads on the bearing that would exist if initial misalignment went uncorrected.

The bearing inner ring is extended on the outboard/locking side. It is locked on the shaft with two stainless steel grub screws that are positioned at 120°, minimising inner ring distortion while maintaining good gripping strength.

The inner ring of the bearing is dimensioned to accommodate the fitting of the back seal, letting the units be deployed in applications

with the highest hygienic design and food safety requirements (e.g. open food processing zones). The sealing system consists of a non-contacting seal and a flinger, located at the outer circumference (**fig. 1**). The flinger provides the first barrier against the ingress of both solid and liquid contaminants. This closes against the bearing outer ring when pressure washed.

Next, the design provides a series of internal concentric “gutters” (**fig. 2**) which contain and collect any drops of detergent that penetrate and then guide them, circumferentially, around and away from the bearing (**fig. 3**).

Due to this innovative design, the sealing performance is not limited by the lip contact force against the shaft. This means that the seal can achieve high levels of protection coupled with low energy consumption. The internal gutters are designed to guide detergent away from the bearing. Whereas the aim of a detergent is to penetrate and clean, this novel approach aims to work with rather than against the detergent.

Fig. 1

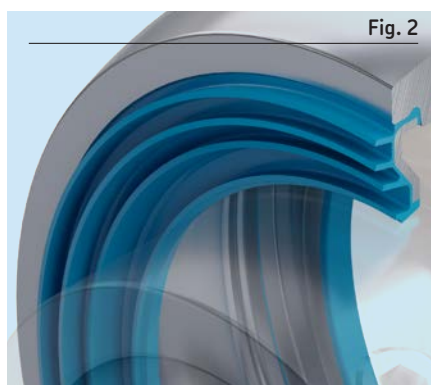

Fig. 2

Fig. 3

*The bearing seals are patented.*

### Sealing system effectiveness

Accelerated testing has shown that this design provides better sealing performance by actively dealing with detergent ingress rather than seeking to passively exclude it. In testing, detergent droplets were allowed to enter the seal at a rate of 5 drops per minute over a period of 500 hours, after which the internals of the seal were examined.

The post-test analyses confirmed that detergent ingress is typically contained within and channelled away by the first or second of the multiple gutters.

In addition, both the friction torque and the temperature measured from trials of the 206 size are considerably reduced, considering that there is only one contacting lip instead of two.

# Bearing grease

All units are lubricated for life with NSF-approved, SKF food-grade grease for relubrication-free operation. The high-quality grease is registered by NSF as a category H1 (lubricant acceptable for use in applications where there is potential for incidental food contact).

The grease has been selected because it provides good resistance to the separation of the base oil and the thickener in the presence of detergent. Greases without this enhanced resistance can separate, resulting in loss of oil past the seal, then loss of lubrication to the seal lips.

This can lead to scoring damage to the mating surface on the inner ring shoulder. The NSF registration confirms this SKF grease fulfils the requirements listed in the US Food and Drug Administration's guidelines under 21 CFR section 178.3570.

The technical specifications of this grease are listed in **table 2**.

The grease contains no ingredients from the 14 allergens and allergen categories that must be declared in food products and is also free from traces of beef, pork and chicken. Additional certifications for the grease have been secured from AMERICAN HALAL FOUNDATION (AHF) and 1K Kosher.

### Allergens and allergen categories

- Cereals containing gluten, namely: wheat (such as spelt and khorasan wheat), rye, barley, oats
- Crustaceans for example prawns, crabs, lobster, crayfish
- Eggs
- Fish
- Peanuts
- Soybeans
- Milk (including lactose)
- Nuts; namely almonds, hazelnuts, walnuts, cashews, pecan nuts, Brazil nuts, pistachio nuts, macadamia (or Queensland) nuts
- Celery (including celeriac)
- Mustard
- Sesame
- Sulphur dioxide/sulphites, where added and at a level above 10 mg/kg or 10 mg/L in the finished product. This can be used as a preservative in dried fruit
- Lupin, which includes lupin seeds and flour and can be found in types of bread, pastries and pasta
- Molluscs like, mussels, whelks, oysters, snails and squid

Table 2

Technical specifications of the SKF GFM grease for Food Line ball bearing units

Temperature range <sup>1)</sup>	Thickener	Base oil type	NLGI consistency class	Base oil viscosity [mm <sup>2</sup> /s]		Grease performance factor (GPF)
				at 40 °C (104 °F)	at 100 °C (212 °F)	
-50 0 50 100 150 200 250 °C  -60 30 120 210 300 390 480 °F	Calcium Sulfonate Complex	Mineral	2	113,0	5,8	1,5

<sup>1)</sup> Refer to SKF catalogue Rolling bearings – the SKF traffic life concept

### Grease effectiveness

In SKF testing, droplets of detergent were injected into the test bearings using a peristaltic pump. The results showed a good resistance to degradation in the presence of detergent.

# Product combinations for special zones and applications

In addition to the completely sealed blue range units, other product combinations are available. For instance, in applications where a fully sealed bearing unit is not required from a food safety perspective, or in environments subject to peak loading. All product combinations feature the same advanced bearing seal arrangement and are supplied lubricated for life with the same highly effective grease as the completely sealed blue range.

## Zones with limited risk of contamination

Closed food processing or areas where packaged goods are being handled are typical zones with limited risk of contamination. The SKF Food Line ball bearing units offer high performing solutions for such areas.

These product combinations include a stainless steel insert bearing in the blue, hygienically designed, composite housing with no backseal.

In addition, there is also the option of ordering the blue end cover which improves personnel safety by enclosing the exposed shaft end.

For applications where it is considered acceptable, the stainless steel bearing can be substituted for a zinc coated insert bearing.

Bearings with this coating resist attack from water and acidic or caustic solutions far better than uncoated insert bearings, or bearings with black oxide coatings.

Composite housing  
(with no backseal)

F2BC 5XX

## Applications subject to peak loads

SKF Food Line stainless steel ball bearings and housings are cast from AISI 300 series stainless steel, providing good durability and resistance to peak loads. Cast stainless steel is resistant to aggressive washdown chemicals. The housings are therefore not affected by strong concentrations of chlorine, hydrogen peroxide and many other chemicals. In addition, the housings feature machined flat bases; the absence of any unnecessary crevices or

pockets on the external surfaces and a smooth finish mean that the stainless steel housings are easy to clean with no recessed areas for debris and bacteria to accumulate or become trapped.

The SKF Food Line ball bearing units with stainless steel housings are offered with stainless steel insert bearings and a white end cover, available as an option.

Oval flanged

Square flanged

# Mounting instructions

## General

To provide proper bearing performance and prevent premature failure, all relevant procedures and cautions should be observed when mounting SKF Food Line ball bearing units.

As precision components, they should be kept clean and handled carefully when mounting. It is also important to choose the appropriate method of mounting and to use the correct tools.

The method used for mounting SKF Food Line ball bearing units depends on the:

- overall machine design
- bearing housing design
- method used to attach the unit to the shaft.

## Tools

To mount or dismount SKF Food Line ball bearing units, the following tools are required:

- a hexagonal key (hex wrench) to tighten or loosen grub (set) screws
- a spanner to tighten or loosen the mounting bolts.

## Mounting bolts

To attach SKF Food Line ball bearing units to the support surface and to increase the hygienic safety for the overall product, SKF recommends using hygienic design bolts and rubberised washers, **fig 1**.

In order to assure the ball bearing unit correct positioning and load withstanding, SKF advises to not exceed the machine wall through holes diameters as per **table 4, 5 and 7**, and to follow the tightening torque values highlighted in **table 2**.

Fig. 1

Table 1

### Recommended fits

Operating conditions	Tolerance class <sup>1)</sup>
$P > 0,05 C$ and/or high speeds	h6
$0,035 C < P \leq 0,05 C$ and/or low speeds	h7
$0,02 C < P \leq 0,035 C$ and/or low speeds	h8
Simple bearing arrangement or $P \leq 0,02 C$	h9–11

<sup>1)</sup> All ISO tolerance classes are valid with the envelope requirements (such as h7(ES)) in accordance with ISO 14405-1.

### ⚠ WARNING

Failure to carefully follow applicable mounting instructions and not to have the metallic bushes in contact with machine frame on composite housing, may result in premature bearing failure or improper performance. For further information, contact the SKF application engineering service.

## Back Seal

The unit with back seal already mounted has to be placed without end cover on the shaft for Pillow block and on the machine frame for flanged units (**fig. 2**).

End cover is mounted in order to complete the unit mounting on the machine position (**fig. 3**).

Fig. 2

## Shaft tolerances

The recommended fits for SKF Food Line ball bearings are listed in **table 1**. For moderate loads ( $0,035 C < P \leq 0,05 C$ ), the shaft seats should be machined to an h7 tolerance.

For light loads and low speeds, an h8 shaft tolerance is sufficient, and for very simple applications, h9 to h11 shaft tolerances may be used.

**Fig. 4** illustrates the relative position of the upper and lower limits of the most commonly used ISO shaft tolerance classes. The values of these ISO tolerances are listed in **table 2**.

Fig. 3

## Permissible speed

SKF Food Line ball bearing units should not operate at speeds above the limiting speeds listed in the product tables. Permissible speed is also influenced by the shaft diameter tolerance.

When using these bearing units on shafts with wider tolerances than h6, compare the speed values listed in the product tables with those listed in **table 3**. The lower value is the maximum or limiting permissible speed.

Fig. 4

**Table 2**

ISO shaft deviations for SKF Food Line

Shaft diameter d	Shaft diameter deviations												
	h6 <sup>Ⓔ</sup>		h7 <sup>Ⓔ</sup>		h8 <sup>Ⓔ</sup>		h9 <sup>Ⓔ</sup>		h10 <sup>Ⓔ</sup>		h11 <sup>Ⓔ</sup>

**Table 3**

Permissible speeds for SKF Food Line

Bearing size <sup>1)</sup>	Permissible speeds for shafts machined to tolerance class			
	h7 <sup>Ⓔ</sup>	h8 <sup>Ⓔ</sup>	h9 <sup>Ⓔ</sup>	h11 <sup>Ⓔ</sup>
d	r/min			
–	r/min			
04	5 300	3 800	1 300	850
05	4 500	3 200	1 000	700
06	4 000	2 800	900	630
07	3 400	2 200	750	530
08	3 000	1 900	670	480
09	2 600	1 600	560	400

<sup>1)</sup> For example, bearing size 07 includes all bearings based on a Y207 bearings such as YAR 207-2LPW/SS, YAR 207-104-2LPW/SS, YAR 207-106-2LPW/SS, YAR 207-107-2LPW/SS.

# Assembling units

In cases where SKF Food Line ball bearings and bearing housings are not supplied as a unit, the first step is to assemble the bearing into the housing.

The mounting procedure is: tighten the housing on the machine frame (**fig. 5**) and place the bearing when the housing is fixed

Insert the bearing into the filling slot in the housing bore (**fig. 6**) and rotate it by hand within the housing until the bearing and housing bore axes align as closely as possible.

### NOTE

The bearing must be inserted so that the inner ring grub screws will be on the front (end cover) side of the housing.

With a round piece of wood or pipe of a suitable diameter as a dummy shaft, now rotate the bearing a few turns in each direction. Whilst exercising the bearing in this way, vary the angle of the "shaft" to encompass all orientations (**fig. 7**).

# Alignment

When mounting SKF Food Line ball bearing units it is important for the performance and longevity of the bearing that any misalignment is kept within acceptable limits (**fig. 8**).

In this regard, the sphered nature of the bearing outer ring and the housing bore can accommodate some static misalignment.

Static, as illustrated above, refers to any initial misalignment between housing and shaft/bearing inner ring arising from mounting errors.

For the fully sealed units this is limited, by the back seal, to  $\pm 1$ -degree, whilst for housings without the back seal, up to  $\pm 5$ -degrees can be accommodated.

By contrast, dynamic misalignment: the operational misalignment of the shaft (between bearings on the same shaft), must be limited to no more than a few minutes of arc.

Fig. 8

# Mounting procedure

1 Remove any burrs on the shaft with emery cloth or a fine file, wipe clean with a cloth. Depending on loads and speeds, define the appropriate shaft tolerance from **tables 1** and **2**, and check the shaft diameter. Mount any components that are on the shaft between the two SKF Food Line ball bearing units make sure the housing base and mating surfaces are clean and free of any debris or burrs. Ensure the supporting surface is flat. The flatness should be within the IT7 tolerance grade and the roughness should be  $Ra \leq 12,5 \mu\text{m}$ . If the housing requires shims or adjustment, the shims must extend the full length and width of the base (**fig. 9**).

- 2 Mount any components that are on the shaft between the two SKF Food Line ball bearing units. Slide the SKF Food Line ball bearing unit onto the shaft with grub screws facing outwards and ensure that shaft is correctly placed (**fig. 10**).
- 3 For plummer block units, fit the attachment bolts but do not tighten them (**fig 11**). For flanged units, fasten them securely to the machine wall. For composite housings assure that the metallic bushes in bolt areas will be in contact with the machine wall.
- 4 Mount the other SKF Food Line ball bearing unit on the other end of the shaft following the phases shown in **fig. 9** to **11**.

**NOTE**

For attachment bolt hole sizes, for reference see **table 4** to **7**.

Fig. 9

Fig. 10

Fig. 11

Table 4

Attachment bolt hole sizes according to DIN EN 20273

Units for metric shafts

Bolt size	Trough hole diameter $d_m$
G	$d_m$
mm	mm
8	9
10	11
12	13,5
16	17,5

Table 5

Attachment bolt hole sizes according to ASME

Units for inch shafts

Bolt size	Trough hole diameter $d_m$
G	$d_m$
in.	in.
3/8	13/32
7/16	15/32
1/2	9/16
5/8	11/16

5 Carefully align both SKF Food Line ball bearing units using the shaft. For plumber block housings, fully tighten the attachment bolts for all units to the tightening torque shown in **fig. 12** and according to **table 7, page 20**.

For flanged housings, securely fasten the second unit to the machine wall (**fig. 13**). Align the shaft in the bearing arrangement axially and – if possible – turn it a few times. Tighten the grub screws in the inner rings of both units to the tightening torque indicated in **table 7, page 20, fig. 14** and **15**. Additionally if applicable, mount the end cover(s).

6 Tighten the grub screws in the inner rings of both units to the tightening torque indicated in **table 6**.

7 If applicable, mount the end cover(s).

–	1/2-13 UNC	–	–	–	–	70
–	5/8-11 UNC	–	–	–	–	100

## End covers

The **product tables 1.1 to 1.13** show the appropriate end cover for each bearing unit and the distance  $A_5$  that the end cover protrudes once mounted on the housing (**fig. 16** and **17**). Prior to starting the mounting procedure, make sure to have available the correct end cover and check if the  $A_5$  dimension is suitable for your application arrangement.

### NOTE

The end cover is sold separately in all the units different from DFH (fully sealed) solution. So for blue range not fully sealed and stainless steel end cover have to be ordered separately.

### ⚠ WARNING

#### Rotating parts hazard.

To avoid serious injury, do not mount or dismount an end cover unless the shaft has stopped rotating and the machine has been locked out or the shaft has been secured so it can't rotate.

## Blue end covers (composite housings)

Fig. 16

### Mounting/dismounting instructions

- 1 Remove the end cover from its packaging.
- 2 Identify the alignment mark on the housing and orientate the end cover so that this is aligned with the "open circle" marking on the end cover:
  -
- 3 Engage and rotate the end cover,  $1/8$  of a turn until the housing marker is now aligned to the closed circle marking on the end cover:
  -

The end cover is now in the closed position.

- 4 To remove, rotate the end cover back so that the housing marker and the open circle align, then pull away the cover.

## White end covers (stainless steel housings)

Fig. 17

### Mounting instructions

- 1 Remove the end cover from its packaging.
- 2 Identify the end cover groove in the housing and make sure it is clean and free of any debris.
- 3 Hold the cover at an angle against the housing and insert the cover tabs into the housing groove.
- 4 Push the cover towards the housing until all the tabs snap into the housing groove. Where needed, help the tabs into position by bending the cover edge slightly as required.
- 5 Make sure the cover is securely in place. If needed, remove the end cap and start the process again from step 2.

### Dismounting instructions

- 1 Insert a screwdriver or a pointed tool into the space between the bearing housing and the dismantling slot on the end cover.
- 2 Unlock the cover by levering it until the first end cover tabs come out from the housing groove. Hold the cover to make sure that it does not fall, and complete the unlocking process by hand.

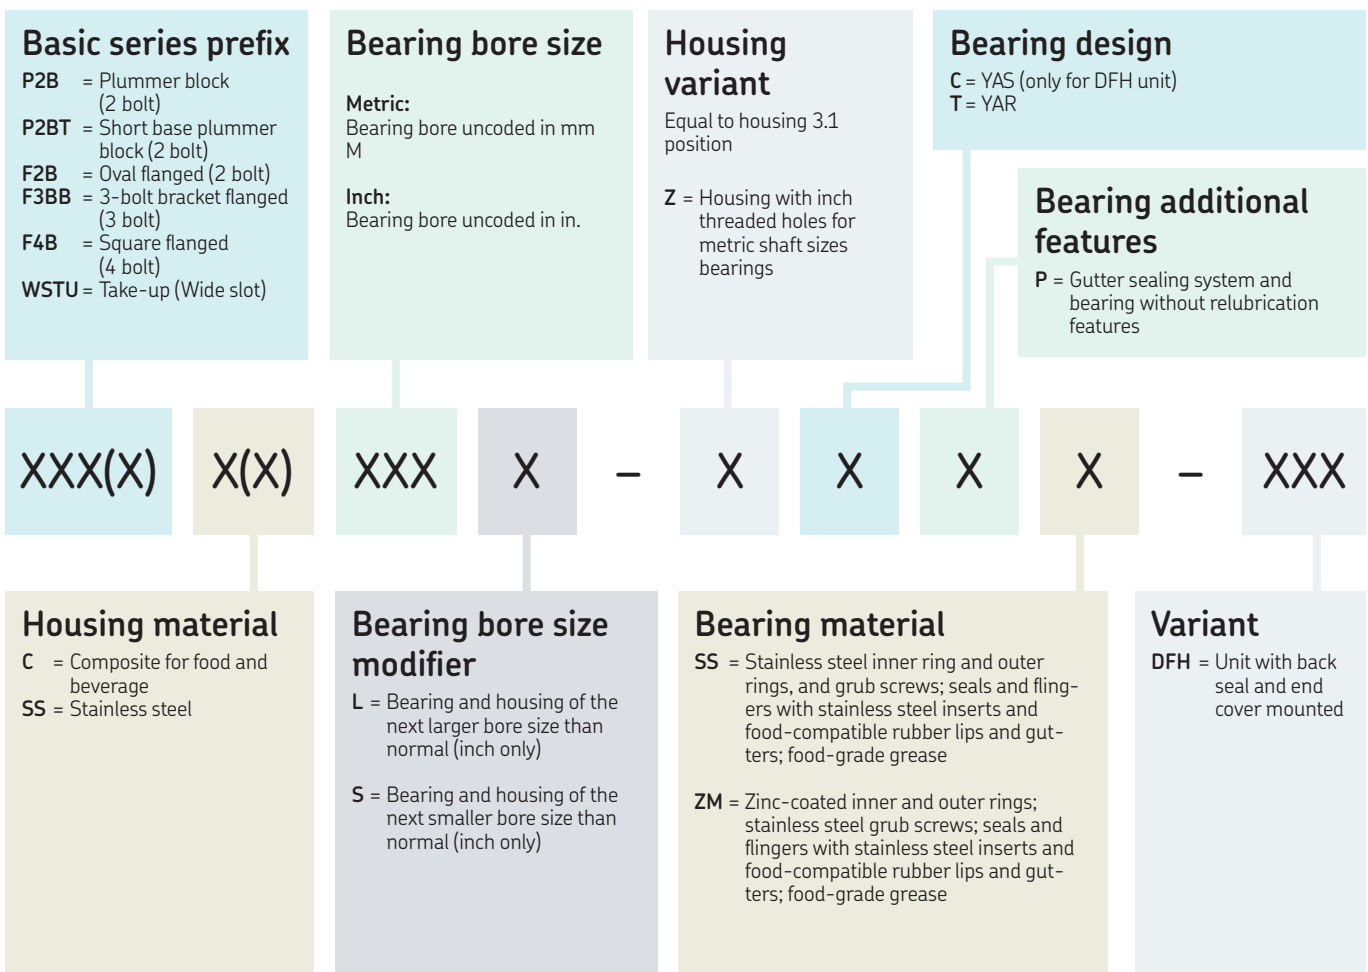

# Product data

## Food and beverages designation rules – Units

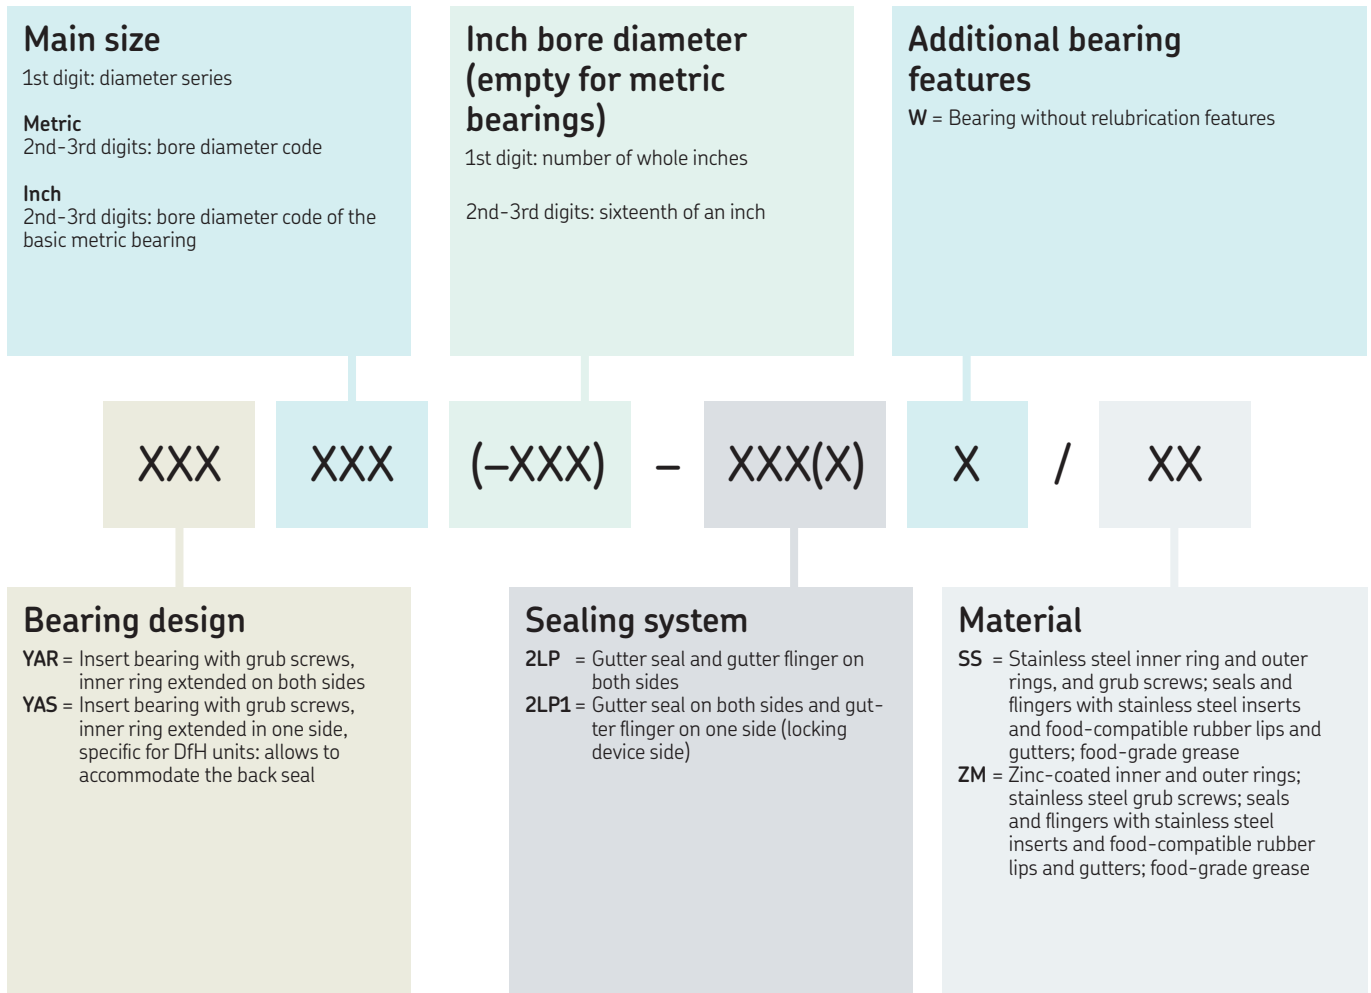

The new designation systems for the SKF Food Line insert bearings and ball bearing units, have been completely renovated in order to be user friendly for a fast as well clear identification, and modular to easily follow the customer desired final variant.

More details about the developed nomenclature can be obtained from the designation charts:

- SKF Food Line ball bearing unit designation system (pages 26 to 87)
- SKF Food Line insert bearing designation system (pages 86 to 87)
